Pitney Bowes' Emtex[®] Software Introduces DFWorks[®] Release 2.4 with Expanded ADF Capabilities

Extended integrity, increased automation, and simplified set-up reduces errors and increases efficiency for print and mailstream workflow

BOCA RATON, FL, August 10, 2007 — Pitney Bowes' Emtex Software, the leading provider of Output Management (OM) and Automated Document Factory (ADF) solutions, has expanded its ADF offerings with DFWorks[®], Release 2.4 to include extensive enhancements, and new feature introduction, Mailrun Management module.

With the new Mailrun Management module, job setup automation is simplified and centralized to improve inserter productivity, increase reporting accuracy and decrease wasted postage. It also helps mailing operations centralize and automate insert plan management for increased operator efficiency and accurate inserter job setup. Time-consuming, manual processes are eliminated, resulting in greater productivity and enhanced compliance processes.

The newly DFWorks enhancements extend the intelligence of the mailstream workflow with additional process automation for precise tracking and easier postage accounting and analysis of high-volume mailing expenditures and charge backs. Inherent in this release is the "At-A-Glance" Productivity Report Module feature that provides a "dashboard" display of productivity metrics on throughput, efficiency, accuracy and device alarm statistics, enabling organizations to drive "Six Sigma" continuous improvement initiatives. Additional

enhancements include a job summary report detailing mail piece status and disposition to provide job-level proof-of-process reporting and satisfy compliance requirements.

DFWorks offers complete flexibility and integration to Pitney Bowes flagship high speed intelligent inserters with scalable integrity solutions for mail piece quality assurance and business intelligent information to help customers make informed decisions.

“Mail stream integrity is increasingly important as both in-house mailers and service bureaus compete for high value mailings and contend with compliance and security demands,” said Dean DeCencio, Emtex Vice President of Sales, North America. “The newest DFWorks module and enhancements provides integrity building blocks with a platform for future ADF expansion.”

DFWorks ADF solutions combined with Output Management offerings rounds out Emtex Production Intelligence. This powerful combination enables businesses of all sizes to link print-to-mail (host-to-post) operations for greater control, and increased accountability and productivity. A live demonstration of Emtex Production Intelligence solutions will be presented at GraphExpo, September 9 - 12 in Chicago at the Pitney Bowes booth 2263.

###

About Emtex Software

Emtex Software is a wholly owned subsidiary of Pitney Bowes and an industry leading provider of innovative output management (VIP™, VDE™, FlexServer® and PROM™) and DFWorks Automated Document Factory (ADF) solutions, providing production intelligence and end-to-end workflow with centralized job and print management, any-to-any transformation, document re-engineering and real-time data collection and reporting to enable organizations to route, transform, track and analyze production workflow. Emtex Output Management and ADF solutions are utilized at over 1,000 production sites worldwide. For more information, please visit www.emtex.com.
